

ЗАДАНИЕ №1.2

Скрипты для запуска санитайзеров:

- Asan

```
#!/bin/bash
```

```
clang -std=c99 -fsanitize=address -fno-omit-frame-pointer -g -c main.c
```

```
clang -std=c99 -fsanitize=address -fno-omit-frame-pointer -g -c file_funcs.c
```

```
clang -fsanitize=address -fno-omit-frame-pointer -g -o app.exe main.o file_funcs.o
```

- Msan

```
#!/bin/bash
```

```
clang -std=c99 -fsanitize=memory -fPIE -fno-omit-frame-pointer -g -c main.c
```

```
clang -std=c99 -fsanitize=memory -fPIE -fno-omit-frame-pointer -g -c file_funcs.c
```

```
clang -fsanitize=memory -fPIE -pie -fno-omit-frame-pointer -g -o app.exe main.o  
file_funcs.o
```

- Ubsan

```
#!/bin/bash
```

```
clang -std=c99 -fsanitize=undefined -fno-omit-frame-pointer -g -c main.c
```

```
clang -std=c99 -fsanitize=undefined -fno-omit-frame-pointer -g -c file_funcs.c
```

```
clang -fsanitize=undefined -fno-omit-frame-pointer -g -o app.exe main.o file_funcs.o
```

Скрипт релизной сборки:

```
#!/bin/bash
```

```
gcc -std=c99 -Wall -Werror -Wpedantic -Wextra -Wfloat-equal -Wfloat-conversion --  
coverage -c main.c
```

```
gcc -std=c99 -Wall -Werror -Wpedantic -Wextra -Wfloat-equal -Wfloat-conversion --coverage -c file_funcs.c  
gcc --coverage -o app.exe main.o file_funcs.o
```

Скрипт дебажной сборки:

```
#!/bin/bash
```

```
gcc -std=c99 -Wall -Werror -Wpedantic -Werror -Wfloat-equal -Wfloat-conversion -g -c main.c  
gcc -std=c99 -Wall -Werror -Wpedantic -Werror -Wfloat-equal -Wfloat-conversion -g -c file_funcs.c  
gcc -g -o app.exe main.o file_funcs.o
```

Скрипт очистки ненужных файлов:

```
#!/bin/bash
```

```
rm -f ./*.exe ./*.o ./*.gcda ./*.gcov ./*.c.gcov ./*.gcno func_tests/scripts/res.txt
```

Скрипт подсчета покрытия кода тестами с помощью утилиты gcov:

```
#!/bin/bash
```

```
cd func_tests/scripts || exit  
./func_tests.sh  
cd ../..  
echo  
echo "Checking coverage of tests"  
gcov main.c  
gcov arr_func.c  
./clean.sh
```

Скрипт, который по очереди запускает программу с одним из видов сборки (с санитайзерами, дебажная и релизная) и тестирует ее:

```
#!/bin/bash
```

```
echo "BUILDING RELEASE..."
```

```
./build_release.sh
```

```
cd func_tests/scripts || exit
```

```
./func_tests.sh
```

```
cd ../..
```

```
echo
```

```
./clean.sh
```

```
echo "BUILDING DEBUG WITH ASAN..."
```

```
./build_debug_asan.sh
```

```
cd func_tests/scripts || exit
```

```
./func_tests.sh
```

```
cd ../..
```

```
echo
```

```
./clean.sh
```

```
echo "BUILDING DEBUG WITH MSAN..."
```

```
./build_debug_msan.sh
```

```
cd func_tests/scripts || exit
```

```
./func_tests.sh
```

```
cd ../..
```

```
echo
```

```
./clean.sh
```

```
echo "BUILDING DEBUG WITH UBSAN..."
```

```
./build_debug_ubsan.sh
```

```
cd func_tests/scripts || exit
```

```
./func_tests.sh
```

```
cd ../../
```

```
echo
```

```
./clean.sh
```

```
echo "BUILDING DEBUG..."
```

```
./build_debug.sh
```

```
cd func_tests/scripts || exit
```

```
./func_tests.sh
```

```
cd ../../
```

```
echo
```

```
./clean.sh
```

Скрипт-компаратор, сравнивает два файла на совпадение числовых значений в них:

```
#!/bin/bash
```

```
arr1=()
```

```
arr2=()
```

```
IFS=' '
```

```
digit="[0-9]"
```

```
while read -r -a arr; do
```

```
  for i in "${arr[@]}"; do
```

```
    if [[ $i =~ $digit ]]; then
```

```
      arr1+=("$i")
```

```
    fi
```

```
done
```

```
done < "$1"
```

```
while read -r -a arr; do
```

```
  for i in "${arr[@]}"; do
```

```
    if [[ $i =~ $digit ]]; then
```

```
      arr2+=("$i")
```

```
    fi
```

```
  done
```

```
done <"$2"
```

```
if [[ "${arr1[*]}" == "${arr2[*]}" ]]; then
```

```
  exit 0
```

```
else
```

```
  exit 1
```

```
fi
```

Скрипт, выполняющий проверку работы программы на одном негативном тесте:

```
#!/bin/bash
```

```
input="$1"
```

```
args=$(cat "$2")
```

```
app="../../app.exe"
```

```
res="res.txt"
```

```
"$app" "../../data/$args" < "$input" > "$res"
```

```
exit $?
```

Скрипт, выполняющий проверку работы программы на одном позитивном тесте:

```
#!/bin/bash
```

```
input="$1"
output="$2"
args=$(cat "$3")
app="../app.exe"
res="res.txt"
"$app" "../data/$args" < "$input" > "$res"
if ./comparator.sh "$output" "$res"; then
    exit 1
else
    exit 0
fi
```

Скрипт, выполняющий функциональное тестирование:

```
#!/bin/bash

count=0

for file in ../data/*_in.txt; do
    if [[ "$file" =~ pos_[0-9][0-9]_in\.txt ]]; then
        echo Checking "$file"...
        num=$(echo "$file" | grep -o "[0-9][0-9]")
        output=$(find ../data/ -name "pos_${num}_out\.txt")
        args=$(find ../data/ -name "pos_${num}_args\.txt")
        if ./pos_case.sh "$file" "$output" "$args"; then
            echo Test pos_"$num" is incorrect
            count=$((count+1))
        else
            echo All is OK
        fi
    fi
done
```

```

elif [[ "$file" =~ neg_[0-9][0-9]_in\.txt ]]; then
    echo Checking "$file"...
    num=$(echo "$file" | grep -o "[0-9][0-9]")
    args=$(find ../data/ -name "neg_$num\_args\.txt")
    if ./neg_case.sh "$file" "$args"; then
        echo Test neg_"$num" incorrect
        count=$((count+1))
    else
        echo All is OK
    fi
fi
done

echo Fails: "$count"
exit $count

```

Также добавляется программа на языке С, которая переводит информацию из текстового файла в бинарный и обратно

```

/*
Предполагается, что во время работы программы не возникнет ошибок
выполнения
*/

```

```

#include <stdio.h>
#include <string.h>

```

```

void text_to_bin(FILE *src, FILE *dst)
{
    int val;

```

```
    while (fscanf(src, "%d", &val) == 1)
        fwrite(&val, sizeof(val), 1, dst);
}
```

```
void bin_to_text(FILE *src, FILE *dst)
{
    int val;
    while (fread(&val, sizeof(val), 1, src) == 1)
        fprintf(dst, "%d\n", val);
}
```

```
int main(int argc, char **argv)
{
    FILE *src, *dst;
    if (argc == 4)
    {
        if (strcmp(argv[1], "t") == 0)
        {
            src = fopen(argv[2], "r");
            dst = fopen(argv[3], "wb");
            text_to_bin(src, dst);
            fclose(src);
            fclose(dst);
        }
        else
        {
            src = fopen(argv[2], "rb");
            dst = fopen(argv[3], "w");
```

```
    bin_to_text(src, dst);
```

```
    fclose(src);
```

```
    fclose(dst);
```

```
    }
```

```
    }
```

```
    return 0;
```

```
}
```
